

How to Run Live Optics on your VMware Cluster

1/ To run live optics, go to <https://www.liveoptics.com/> and select **Corporate Edition** which will take you to a profile setup page.

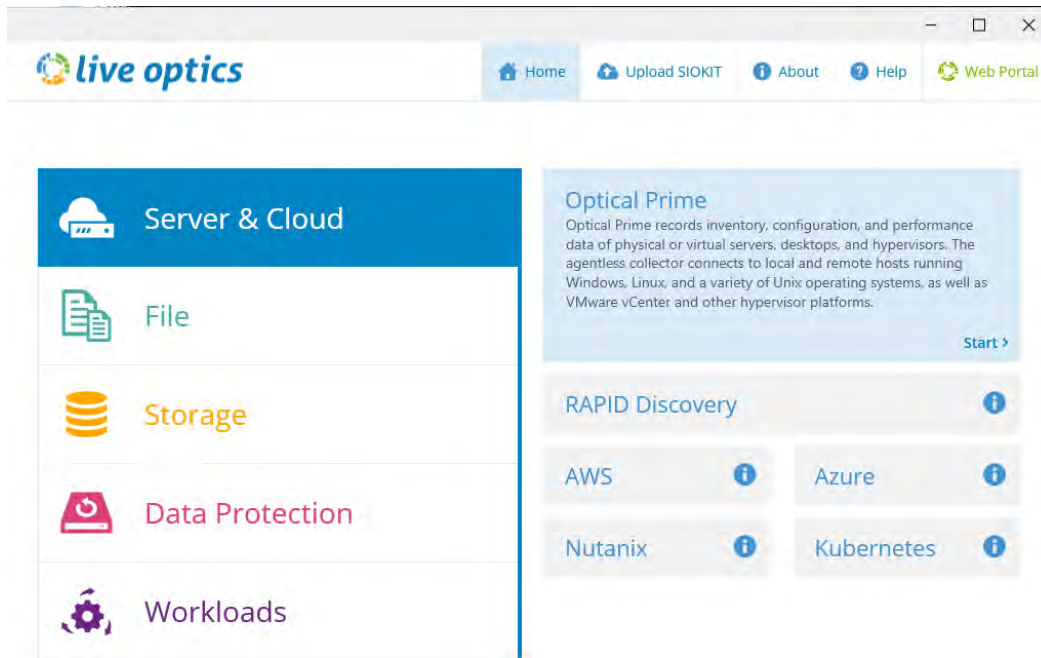

2/ Keep **IT Professional** selected, there is no cost for registration. Once logged in, in the top left select **Download Collector**.

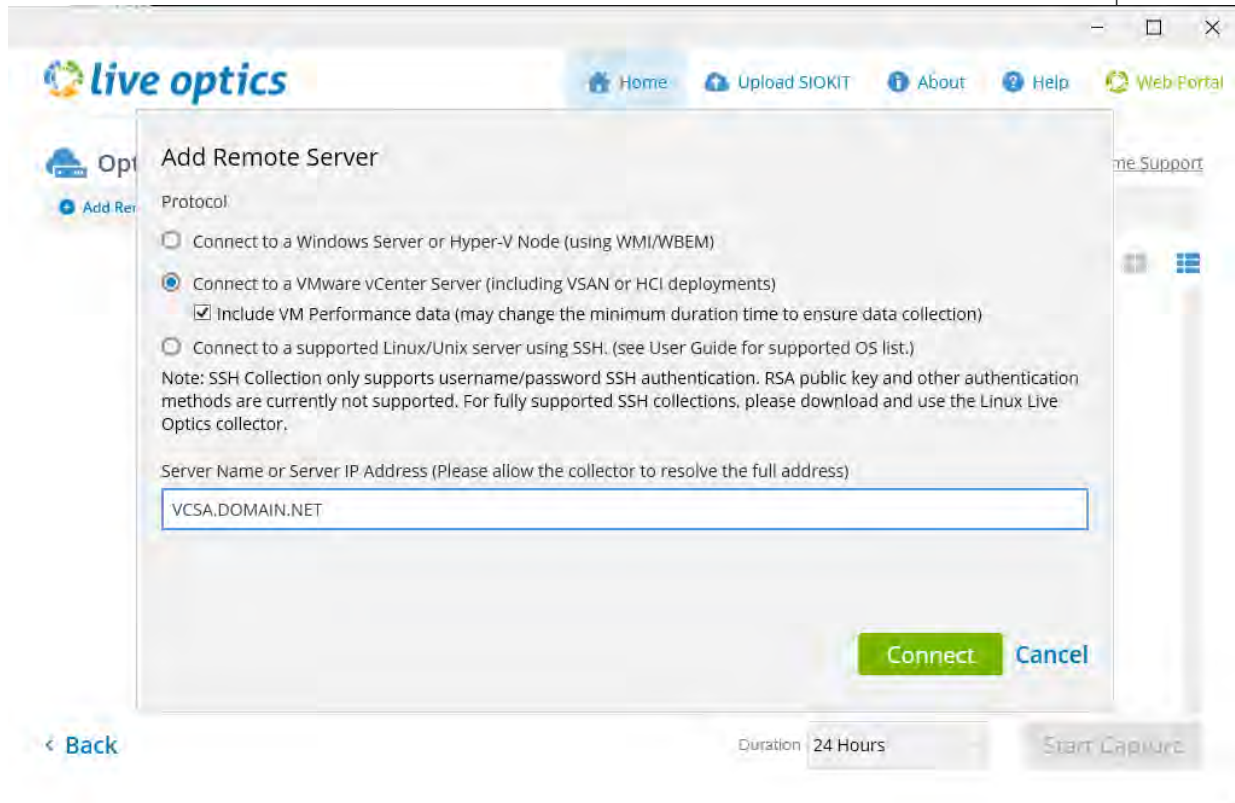

This collector will need to run uninterrupted for 2-5 days, so my preference is to run this on a utility VM, but if you'd like you can run it from a Windows or Linux workstation.

3/ Launch the collector and click **Next** a few times, then under "Server & Cloud" run **Optical Prime**, then click **Next**.

4/ Give the project a name with your organization name in the title.

5/ Click **Next** a couple times, then click **Add Server**, and select **vCenter**, provide the VCSA name, and change the duration. You can add multiple VCSAs if you have them.

6/ Click **Start Capture**.

7/ After the capture is started, you can share the project from the Live Optics web portal.
